

Microba Pty Ltd Company Profile

Overview

Microba Pty Ltd is a microbial genomics company using one of the most advanced sequencing technologies, whole genome sequencing (WGS), to advance our understanding of how the human microbiome influences disease. Microba will build the world's first, large scale genome database of human gut microbiome and associated metadata. This will be used to develop microbial-based treatments and disease screening tests.

To build the database, Microba will make WGS technology available to consumers and healthcare practitioners to assess gut health by providing the most detailed reports on the gut microbiome currently available. Microba uses proprietary processing pipelines and algorithms developed at the Australian Centre for Ecogenomics at the University of Queensland to analyse WGS data and generate reports at a competitive price point.

Speaker Profile
